Most often, the illness is not serious and resolves on its own, but it has the potential to cause widespread illness and death during a pandemic. I use mathematical models of the infection process to study the causes of severe influenza, the emergence of drug resistance, the role of the immune response in clearing the infection, and antiviral treatment. The long-term goal of this research is to develop an accurate model of the infection in humans which can then be used to test a wide variety of drug treatment protocols and to simulate drug or vaccine treatment in high risk patients, reducing the risk to these patients.
